

# LLM Apps

Full Stack App: Chat-LlamaIndex

# Features of this application

- It is a starter template for creating a RAG application for chatting with your private documents.
- It is similar to the create-llama starter template with Node.js Serverless, but in this case, the application allows file uploads through the UI instead of having to manually put them in the app file as we do with create-llama.

# Comments on this application

- Uses the Typescript version of LlamaIndex, not the Python version.
- Falls a bit short for professional application, as it does not use:
  - Backend API
  - Backend database
